1 FIG-209 — Mace candidate eval

Group: MACE-CANDIDATE-EVAL **Evidence chain:** manifested **Status:** runtime-coverage diagnostic; not a model accuracy benchmark

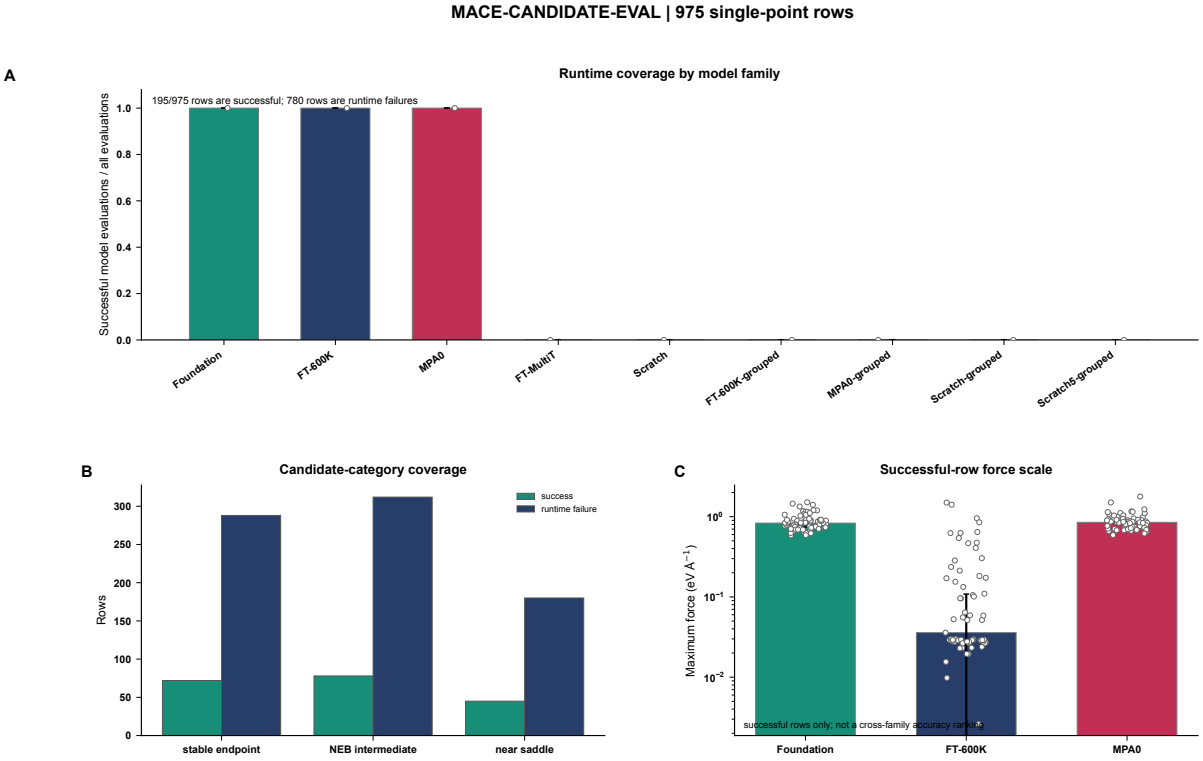

Figure 1: A, runtime coverage across the nine registered model families; B, successful versus runtime-failure rows by candidate type; C, maximum-force distribution for the three model labels with successful rows. This page shows the Plot Atlas table-backed candidate "Mace candidate eval"; its scientific status and caveats are reproduced from the package manifest.

Results text draft. The table contains 975 rows: 195 successful evaluations and 780 runtime failures. The successful rows are limited to Foundation, FT-600K, and MPA0 labels; the grouped-seed, Scratch, and FT-MultiT branches are not scientifically failed model evaluations here because their recorded runtime error is the missing NVIDIA driver. **Discussion and boundary.** This figure is a campaign/runtime coverage audit and a force-scale diagnostic. It should be used to explain why the current candidate-evaluation ablation cannot support a complete model-family ranking or grouped-seed conclusion. **Article placement.** Proposed article location: Results/SI: candidate selection and model-evaluation coverage audit. **Reviewer linkage:** overall status NO_DIRECT_REVIEWER_FIGURE_LINK. No direct reviewer-response figure linkage was identified; retain this page for scientific/article audit. **Evidence pointers.**

Audit gap / next action: The runtime failure traceback identifies a missing NVIDIA driver; do not relabel those rows as model-quality failures. Absolute energies are not comparable across model families; this package uses status and force-scale fields only. The 65-candidate manifest and selection provenance remain the source of candidate identity.
